/note="Organ: prostate; Vector: pDNR-LIB (Clontech);
Site_1: Sfi1 (ggccgctcggcc); Site_2: Sfi1 (ggccattatggcc); Double-stranded cDNA was prepared from cell line RNA.
5' and 3' adaptors were used in cloning as follows: 5' adaptor sequence: 5'-CACGGCCATATGGCC3' and 3' adaptor sequence: 5'-ATTATAGAGCGAGGCGCGCAAGG-dT (30)BN-3' (where B = A, C, or G and N = A, C, G, or T). Average insert size 1.5 kb (range 0.9-4.0 kb): 14/15 colonies contained inserts by PCR. This library was enriched for full-length clones and was constructed by Clontech Laboratories (Palo Alto, CA). Note: this is a NIH_MGC

cancer predisposing gene HPC2, which is found on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs. This sequence was isolated by cloning and sequencing the region of the genome which appeared to cause a predisposition to prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                            25989

which represent the human ORFX open reading frames 1 to 3161. The ORFX
sequences have activitiess such as: cytostatic; hepatotropic; vulnerary;
sequences have activities such as: cytostatic; hepatotropic; vulnerary;
correspathic; antiparkinsonian; nootropic; neuroprotective;
costeopathic; anticonvulsant; antiarthritic; immunosuppressant;
finannostimulant; cardiant; thrombolytic; coaqulant; vasotropic;
controllabetic; hypotensive; dermatological; immunosuppressive;
antidiabetic; hypotensive; dermatological; in the presence of or predisposition to, or preventing or treating
the presence of or predisposition to, or preventing or treating
the presence of or predisposition to, or preventing or treating
the proteins and nucleic acids may be used to treat cancers,
proliferative disorders, neurodegenerative disorders, osteoarthritis,
cofraft vs host disease, cardiovascular disease, diabetes mellitus,
cofraft vs host disease, cardiovascular disease, diabetes mellitus,
cofraft vs host disease, candbined immunodeficiency (SCID), AIDS, viral,
bacterial or fungal infection, malaria, auticimmune disorders, asthma,
allergies, aplastic aneemia, burns, wounds, bone and cartilage damage,
nocturnal haemoglobinuria, antilifiammatory disease; to enhance
coagulation; to inhibit thrombosis; and as a contraceptive.

                                                                                                                                                                                       contains 23 exons and is located at chromosome 17p11.2. The present sequence is clone lambda29.1 from a human testes CDNA library. It was isolated using human EST sequences with sequence similarity to the non-CTPSR family as a probe to screen the library. The cDNA insert was subcloned and the DNA sequence of both strands was determined. The sequence may be used to treat a patient suffering from hSG deficiency by replacing, repairing, or compensating for a DNA sequence within that

The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polynucleotides. The probes can be used for chromosome mapping of the polynucleotide and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polynucleotides and their gene products are used as genetic or bhochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and antibodies against them can be used in pharmaccutical compositions to treat the cancers and proliferative disorders such as neoplasia,

                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTRN of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                           New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 183 BP; 36 A; 63 C; 38 G; 46 T; 0 other;

```

Homo sapiens.

```
Two human bacterial artificial chromosome (BAC) clones that included and flanked the human CTLA-4 locus were cloned and sequenced. The sequence data was assembled into a contiguous sequence that is presented in AAA96363-68. AAA96363-64. Comprise BAC clone 22700, and AAA96365-68 comprise BAC clone 22700, and AAA96365-68 microsatellite repeat (PMR) sequences contain polymorphic microsatellite repeat (PMR) sequences. The specification describes a method for determining the predisposition of a human subject to develop autoimmune disease. The method comprises detecting a PMR sequence in the CD28, ICOS gene or CTLA4 gene of the human costimulatory receptor gene locus (HCGRL). PMR sequences vary in length among individuals and can be amplified to generate products that differ in size. These products can then be detected by rapid and convenient high resolution processes. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Determining predisposition of humans to develop autoimmune disease involves detecting polymorphic microsatellite repeat sequence within human costimulatory receptor gene locus

   ö
method is useful for determining the predisposition of insulin-dependent
           diabetes mellitus (IDDM), Addison's disease, Graves disease, autolmmune hypothyroidism, myasthenia gravis, thymoma, lupus, thyroiditis, postpartum thyroiditis, rheumatoid arthritis, Hashimoto's disease, coeliac disease and leprosy. PMR sequences within hCRGL are useful as markers in a variety of assays and in the field of forensic medicine, disease diagnosis and human genome mapping.

The present sequence represents a genomic sequence of human geranylgeranyl pyrophosphate synthetase (hGGPS). The sequence comprises the 5' regulatory region, the exons and introns, and comprises the 5' regulatory region. Two differently spliced mRNAs exist for this gene. The first spliced mRNA is derived from a cDNA (AAZ60888) which comprises lbis, 2, 3 and 4. The second mRNA is derived from a cDNA (AAZ60889) which comprises lbis, 2, 3, and 4. The hGGPPS gene is located on chromosome 1, at the 1442-1443 locus. This chromosome 1 locus has been shown to carry a predisposing gene for prostate cancer. The nucleic acids encoding hGGPPS can be used for screening for agents which modulate the expression of the hGGPPS gene. Such agents which modulate the expression of the hGGPPS gene. Such agents the hGGPPS gene can be used for the diagnosis of diseases related to an alteration in the regulatory or coding regions of hGGPPS, such as pathologies related to a defect in the mevalonic biosynthetic pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated human geranyl-geranyl pyrophosphate synthetase nucleic acids, used to develop agents for the diagnosis of, e.g. pathologies related to a defect in the mevalonic biosynthetic pathway -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                   AAZ79917 to AAZ80766 represent double stranded cDNA clones isolated from the human colorectal adenocarcinoma (colon cancer) cell line SW480. The cDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           expressed sequence tag; secreted protein; cDNA isolation;
                                                                                                                                                                                                                    present in a human tumour, particularly in solid tumours, e.g. carchiomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of disorders involving unwanted cell proliferation, such as neoplasia,

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8353 agaagagatagcagatcttcagaaaagctgatggaaggccgggtgcagtggctcacgcct 8412

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of the 5' untranslated region of the human ATP binding cassette protein ABCG1 (ABC8) gene. ABCG1 is a cholesterol switch. It is up-regulated by macrophage colony stimulating factor dependent phagocytic differentiation, and expression is massively induced by cholesterol loading and almost completely set back to differentiation dependent levels by HDL3. ABCG1 is the human homologue of the Drosophila white gene. Sequencing of the promoter revealed important transcription factor binding sites relevant for phagocytic differentiation and lipid censityity; ABCG1 was also identified as a cholesterol. Transporter and modulator of choline-containing phospholipids (phosphatidylcholine, sphingomyelin). The invention provides cholesterol-sensitive ABC genes (see AA294734-63) that can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Adenosine triphosphate binding proteins useful for identifying agents for treating atherosclerosis and other inflammatory disorders ^{\rm -}

A method has also bee described for determining a subject's susceptibility to developing chronic obstructive airway disease (COAD) or for predicting the rapidity or ultimate progression of a COAD in the subject by: (a) obtaining a nucleic acid sample from the subject; and (b) detecting at least one allele of an IL-1 proinflammatory haplotype in the sample, where detection of at least one of these alleles indicates that the patient has an increased susceptibility to developing COAD. The method is useful for determining
                                                                                                                                                                                                                                                                                                                                                                       Gaps
           ABCG1 is the human homologue of the Drosophila white gene.
Sequencing of the promoter revealed important transcription factor
binding sites relevant for phagocytic differentiation and lipid
sensitivity. ABCG1 was also identified as a cholesterol
transporter and modulator of choline-containing phospholipids
(phosphatidylcholine, sphingomyelin). The invention provides
cholesterol-sensitive ABC genes (see AAC94734-63) that can be used
for diagnostic and therapeutic applications, and for biochemical useful for the treatment of lipid disorders, atherosclerosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; interleukin 1; IL-1B; IL-1R; IL-1RN; diagnosis; detection; chronic obstructive airway disease; chronic bronchitis; emphysema; asthma; chronic bronchiolitis; proinflammatory haplotype; ss.
completely set back to differentiation dependent levels by HDL3.

In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and

the susceptibility of subjects to developing chronic obstructive airway
                                                                                 early identification of chronic obstructive airway disease (COAD), facilitating administration of appropriate treatment at the earliest stage, thereby increasing the probability of a positive outcome. The present sequence represents the human IL-1B gene.
                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                  ö

activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system receptors, ONS and peripheral nervous and non-nervous system receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease condition selected from pulmonary vasoconstriction, inflammation, allergyies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic thinitis (AR), pulmonary condition emphysema, chronic obstructive pulmonary distress syndrome (Appertunction).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Method for predicting the risk of interstitial lung disease, comprising detecting an interleukin-1 receptor antagonist allele and tumor necrosis alpha allele or an allele in linkage disequilibrium with

                                                                                                                                                                                                                         ö
       The present sequence is provided in a specification relating to a method for determining whether a subject has or is predisposed to develop an interstitial lung disease. The method involves detecting an interleukin-1 receptor antagonist (IL-IRN) (+2018) allele 2, a tumour necrosis alpha (TNF-A)(-308) allele 2, or an allele in linkage disequilibrium with either of these two alleles. The method may be used to determine whether a subject has or is predisposed to develop an interstitial pneumonia or a pulmonary fibrosis and other disorders such as rheumatoid arthritis, asystemic lupus exythmatosis, Sjogren's syndrome, systemic sclerosis, dermatomycoitis. The method is also used for identifying molecules which can be used as therapeutics for treating interstitial lung disease.
                                                                                                                                                                                                                                             Novel methods and nucleic acids for diagnosing and treating disorders associated with high levels of interleukin lbeta, especially

The present sequence is that of human interleukin-1 beta (IL-1B)
allele 1 (+6912), which is a form of the IL-1B gene that contains
cytosine at position (96212). IL-1B allele 2 (+6912) has guanhe at
this position (see AAA50175). The invention is based on the
identification of this novel allele at marker +6912 of the IL-1B
gene. The C to G transition occurs within the 3' untranslated
cregion of the IL-1B gene and results in an increased level of IL-1B
protein. Individuals homozygous for the IL-1B allele 2 (+6912)
credion of the IL-1B gene and results in an increased level of IL-1B
protein. Individuals homozygous for the IL-1B allele 2 (+6912)
ccumulate approximately 4 times more immunoreactive IL-1B protein
than homozygotes for IL-1B allele 1 (+6912), or an allele in
than homozygotes for IL-1B allele 2 (+6912), or an allele in
provided for detecting IL-1B allele 2 (+6912), or an allele in
linkage disequilibrium with an IL-1B allele 2 (+6912), and
thereby determining a patient's susceptibility to developing
inflammatory disorders, especially coronary artery disease,
osteoporosis, nephropathy in diabetes mellitus, alopecia areata,
craves disease, systemic lupus erythematosus, libens acclaroals,
uvenile chronic arthritis, psoriasis, insulin dependent diabetes,
the protein of the IL-1B allele 2 (+6912) and its involvement in
IL-1B overproduction also eables screening assays for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     IL-IB antagonists that can be used to treat conditions associated with IL-IB allele 2 (+6912). Transgenic animals are also claimed, and can be used to identify IL-IB agonists and antagonists, or

The present sequence is that of human interleukin-1 beta (TL-1B) allele 2 (+6912), which is a form of the IL-1B gene that contains guanine at position (see AA5014). The allele 1 (+6912) has cytosine at this position (see AA5014). The invention is based on the identification of this novel allele at marker +6912 of the IL-1B gene. The C to G transition occurs within the 3' untranslated region of the IL-1B gene and results in an increased level of IL-1B protein. Individuals homozygous for the IL-1B allele 2 (+6912) accumulate approximately 4 times more immunoreactive IL-1B protein than homozygotes for IL-1B allele 1 (+6912), or an allele in provided for detecting IL-1B allele 2 (+6912), and thereby detecting IL-1B allele 2 (+6912), and linkage disequilibrium with an IL-1B allele 2 (+6912), and linkage disequilibrium with an IL-1B allele 2 (+6912), and inflammatory disorders, especially coronary artery disease, osteoporosis, nephropathy in diabetes mellitus, alopecia areata, of Gaves disease, systemic inpus erythematosus, lichen sclerosis, ulcerative colitis, diabetic retinopathy, periodontal disease, juvenile chronic inflammatory liver disease, colitis, diabetic retinopathy, periodontal disease, then disease, lung fibrosis, and rheumatoid arthritis (claimed): IL-1B netagonists that can be used to treat conditions associated with IL-1B allele 2 (+6912) and its involvement in IL-1B antagonists colaimed, with IL-1B allele 2 (+6912) and antagonists, or and can be used to identify IL-1B agonists, or

The ON can have antilinflammatory, antiallergic, antialergic, antialergic, antialergic, oytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distances syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary diseases (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONS reduces down with the release of decyydenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA33312 represent the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID No:1 to 2815, and then the last 185 sequences are also called SEQ ID No:1 to 185, but the sequences differ from the previously named sequences. SEQ ID No:11 to 1680 (AAA33333 to AAA3992) are specifically claimed ONs from the present invention N. B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Qy 11740 tttttttgagaacagagtctcactctgtcgcccaggctggagtgcagtggcacgatctcgg 11799

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The method is useful for determining whether a subject has or is predisposed to inflammatory disease, a degenerative disease, an immunological disorder, an infectious disease, trauma induced disease, or cancer. The above conditions associated with an IL-1 inflammatory haplotype can be treated or prevented by administering a therapeutic that compensates for a causative mutation that is in linkage disequilibrium with at least one IL-1 polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a new method for determining whether a subject has or is predisposed to developing a disease or condition that is associated with an IL (interleukin)-1 inflammatory haplotype, comprises detecting at least one allele of the haplotype, where the presence of the allele indicates that the subject is predisposed to the development or has the disease or condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; IL-1A; interleukin-lalpha; IL-1B; interleukin-lbeta; IL-1RN; interleukin-1 receptor antagonist; vasotropic; antiinflammatory; hypotensive; anticoaqulant; antilipaemic; arterial restenosis; restenosis associated allele; RAA; occlusive cardiovascular disorder; restenosis detection; ds.

                                                                                                                                                                                                                                                The present sequence is given in a specification relating to a method for determining whether a subject has or is predisposed to developing an arterial restenosis. The method comprises detecting a restenosis as associated allele (RAA) in a nucleic ascided from the subject, where detection of the RAA indicates that the subject has or is predisposed to the development of a restenosis. The restenosis associated allelic pattern permits the diagnosis of occlusive cardiovascular disorder. The diagnosis allows the most suitable treatment methods for restenosis to be used e.g. selecting therapies for initial vascular stenosis most likely to avoid subsequent stenoses. The detection methods identify restenosis therapeutics, agonists and antagonists, (proteins, peptidomimetics, small molecules or nucleic acids, e.g. anti-sense, ribozyme and triplex nucleic acids) which are used to treat restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tango-77; human; IL-1ra; cytokine superfamily; inflammation; inhibition; interleukin-1 receptor; IL-1R; regulation; asthma; rheumatoid arthritis; chronic myelogenous leukaemia; psoriasis; inflammatory bowel disease; growth factors; treatment; II-1 receptor complex; BAC; ss.

                                                                                    AAX02956-X03048 and AAX22301-X22304 are overlapping BAC genomic sequences containing alternatively spliced forms of human IL-Ira. Such fragments are used in the method of the invention which describes the isolation of a novel human TAMO-77 encoding nucleic acid and protein. Tango-77 is a member of the cytokine superfamily that is expected to Inhibit inflammation by binding to the interleukin-1 receptor (IL-IR). It may also bind to a new receptor so could regulate other cellular processes associated with acute or chronic inflammation, e.g. asthmatchnic myelogenous leukaemia, rheumatoid arthritis, psoriasis and chronic myelogenous leukaemia, rheumatoid arthritis, psoriasis and cytokines and growth factors. Modulators of this protein are used to treat or prevent conditions associated with abnormal levels of inflammation, or activity of IL-1 or its receptor complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tango-77; human; IL-1ra; cytokine superfamily; inflammation; inhibition; interleukin-1 receptor; IL-1R; regulation; asthma; rheumatoid arthritis; chronic myelogenous leukaemia; psoriasis; inflammatory bowel disease; growth factors; treatment; IL-1 receptor complex; BAC; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAX02956-X03048 and AAX22301-X22304 are overlapping BAC genomic sequences containing alternatively spliced forms of human IL-Ira. inhibit inflammation by binding to the interleukin-1 receptor (IL-IR). It may also bind to a new receptor so could regulate other cellular processes associated with acute or chronic inflammation, e.g. asthma, chronic myelogenous leukaemia, rheumatoid arthritis, psoriasis and inflammatory bowel disease. It may also induce or suppress interleukins, eytokines and growth factors. Modulators of this protein are used to treat or prevent conditions associated with abnormal levels of inflammation, or activity of IL-1 or its receptor complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pain; cystic fibrosis; allergic rhinitis; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;

In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treating

transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonuclectides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system receptors. CNS and peripheral nervous and non-nervous system peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the present invention.

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstriction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or cancers

```
The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergites, and/or inflammation. The ON can have antiinflammatory, antiallergites, and/or confidence acids involved in bronchoconstriction, allergites, and/or antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation.

Consequence afflict the lungs of a subject. They can be used for treating e.g. ischemic conditions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carbinary disease (CODP), and cancers such as leukammias, impediance ancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONS break down with the crease of deoxyadenosine which activates adenosine receptors causing conclude sequences given in the sequence listing from the present to invention, which correspond to SEQ ID NO:1 to 2815, but the sequences of differ from the previously named sequences. SEQ ID NO:1 to 1885, but the present content of invention AAA3333 to AAAA3333 to AAA3333 to AAA3333 to AAA3333 to AAA3333 to AAA3333 to A

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs 5' ESTs are also used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Leucocyte specific transcript; LST-1; cytokine; immunoregulator; lymphoma; U-937; antitumour; tumour; gene therapy; diagnosis; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 310 BP; 69 A; 74 C; 87 G; 76 T; 4 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes low adenosine (A) content antisense oligonuclectides and compositions (I) comprising them. In the antisense oligonuclectides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodiator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonuclectides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and malignancies, such as stimulating and crivating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradykinin receptors, central chemokine receptors, adenosine receptors, bradykinin receptors, central
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                receptors, CNS and peripheral nervous and non-nervous system peptides transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, alleray(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiratory distress syndrome (C RDS), pain, cystic fibrosis (CT), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAR18434 to AAR21843 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation;
gene therapy; chromosome mapping; ss.

C by human lymphoma U-937 (DSM ACC 5) cells is stimulated more than 100-fold by interferon-gamma and which binds to the surface of eucocytes. The gene was obtd. by screening cosmid library cah, c produced from human B cell line CAH genomic DNA, with a TNFA probe. Plasmid pLST-1 contg. the LST-1 gene has been deposited as DSM (10011. LST-1 genomic DNA or cDNA (see also AAT48738) can be used to produce recombinant LST-1 in prokaryotic or eukaryotic host cells. LST-1, opt. generated in vivo from DNA constructs, is useful as an immunoregulatory and antitumour agent, esp. as it modulates co-operation between T cells and macrophages. LST-1 DNA can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New immunoregulatory protein, LST-1, derived from human lymphoma cell line - binds to the surface of leucocytes, useful for treatment and diagnosis of tumours

The novel LSR binds lipoproteins in presence of free fatty acids (FFA) and binds cytokines in absence of FFA. The nucleic acid and its fragments are used as probes and primers for detection and/or amplification of LSR genes; for production of recombinant LSR; for detecting allelic variants, mutations, deletions, loss of heterozygosity and genetic abnormalities in the gene. LSR, recombinant cells and transgenic animals are used to screen for chemical interacting with LSR,
                                                                                                                                                                                                                                                                                                                                                                                                                                  gctaatttttgtatttttttagtagagacggggtttcaccatgttggccaggatggtct 10548

immunoregulatory protein (AAW07680), leukocyte specific transcript-1
                 (LST-1), which is characterised in that its prodn. in 1937 cell lines is stimulated by interferon-gamma by a factor of over 1000 and that it binds to the surface of leukocytes. The gene was obtd. from a human B-cell line CAH cosmid library by hybridization to a TNFA probe. Alternative splicing yields a 97-amino acid LST-1 isoform (AAM07681). An LST-1 cDNA clone (AAM45452) has also been isolated. LST-1 nucleic acids can be used for recombinant protein prodn., as probes, and in the gene therapy of e.g. tumours, esp. using methods based on homologous recombination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents the genomic region containing the coding region for the human lipolysis stimulated receptor (LSR). The novel LSR binds lipoproteins in presence of free fatty acids (FFA) and binds cytokines in absence of FFA. The nucleic acid and its fragments are used as probes and primers for detection and/or amplification of LSR genes; for production of recombinant LSR; for detecting allelic variants, mutations, deletions, loss of heteroxygosity and genetic abnormalities in the gene. LSR, recombinant cells and transgenic animals are used to screen for chemical interacting with LSR, also to study expression and activity of LSR and its interactions. The chemicals, and leptin, are used to modulate the number of LSR in a cell, its recycling rate and/or specificity of receptor activity, particularly for reducing the level of
                             its recycling rate and/or specificity of receptor activity, particularly for reducing the level of leptin, lipoproteins, chylomicrons and/or triglycerides. The chemicals are thus useful for treating eating disorders, particularly obesity (and related diseases such as atheromatosis, atheroselerosis, hypertension and diabetes) or anorexia,

                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the human polycystic kidney disease 1 (PKD1) gene. The PKD1 gene or polypeptide may be used to treat autosomal dominant polycystic kidney disease (AFKD), and identify carriers of mutant PKD1 genes, i.e. subjects susceptible to AFKD. Antibodies (AD) that distinguish between normal and mutant PKD1 sequences can also be used in diagnostic tests. Anti-PKD1 AD may also be used to perform subcellular and histochemical localisation studies, and to block the function of PKD1. Ab are also useful in rational drug design studies to identify and test inhibitors of PKD1. Sense and antisense sequences derived from the PKD1 gene may
                                                                                                                                                                                                                                                                                                                                                                                     Human polycystic kidney disease gene, PKD1 - useful to treat and diagnose human autosomal or adult onset polycystic kidney disease

ö
The present sequence is that of the normal human PKD1 gene from chromosome 16. Mutations in this gene (e.g. transitions, transversions, deletions and/or insertions) are associated with a cadult-onset polycystic kidney disease (APKD). The PKD1 locus is adult-onset polycystic kidney disease (APKD). The PKD1 locus is CC-rich (62.4%). Comparison of this sequence with a previously reported partial cDNA sequence revealed differences at three locations (see features table). The most significant difference is the presence of two additional cytosine residues on the plus-strand at position 456 of the previously reported sequence. The insertion results in a frame-shift in the predicted protein coding sequence, cleading to replacement of 92 C-terminal amino acids with a novel. Is amino acid C-terminals. The PKD1 gene contains 23 Alu repeats.

There is a region consisting of 17 tandem copies of a perfect 27 bp repeat and two large CT-rich regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                 Human PKD1 locus between chromosomal markers ATPL (ATP6C) and D16S84.
                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the human polycystic kidney disease 1 (PMD1) locus between chromosomal markers ATPL (ATPGC) and D16S84. The PMD1 gene or polypeptide may be used to treat autosomal before dominant polycystic kidney disease (APMD), and identify carriers of mutant PMD1 genes, i.e. subjects susceptible to APMD. Antibodies (Ab) that distinguish between normal and mutant PMD1 sequences can also be used in diagnostic tests. Anti-PMD1 Ab may also be used to perform subcellular and histochemical localisation studies, and to block the function of PMD1. Ab are also useful in rational drug design studies to identify and test inhibitors of PMD1. Sense and antisense sequences derived from the PMD1 gene may used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; secreted protein; diagnosis; cytostatic; immunosuppressive;

The polynucleotide sequences given in AA298017 to AA298108 encode the human secreted proteins given in AAY87064 to AAX8723. Human secreted burners given in AAX87064 to AAX87223. Human secreted corporation can have activities based on the tissues and cells the genes are expressed in. Examples of activities include: cytostatic; immunosuppressive, antiinflammatory; nootropic; neuroprotective; and antiallergic. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new colynucleotides. Human secreted protein s and their polynucleotides can be used for developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, diseases of the immune system, autoimmune diseases, hopatic and renal diseases, inflammation, allergies, alzheimer's disease, behavioural disorders, schizophrenia, cardiovascular disorders, reproductive disorders, gastrointestinal cardiovascular disorders, reproductive disorders, gastrointestinal disorders, respiratory disorders asthma, sepsis, and proteins are also used as food additives or proteins or polynucleotides can also be used as food additives or proteins are also useful for identifying their chied the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                         has different expression from the normal protein when in an Alzheimer's disease patient"
                                                                                                                                                                                                                                                                                                                                                                                  has different expression from the normal protein when in an Alzheimer's disease patient"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a DNA fragment which is complementary the mRNA sequences whose level of expression in the brains of Alzheimer's disease patients varies from normal individuals. The present sequence represents a specifically claimed DNA fragment in which the expression is augmented to at least twice that in normal cases. The sequence, and antibodies to the proteins encoded by the sequence, may be used in the diagnosis, treatment and investigation of Alzheimer's disease.
                                                                                                       Human; brain; Alzheimer's disease; diagnosis; antibody; expression; ds

Methods from the present invention may be used to select individuals for clinical trials and predict responses to treatment with drugs. The polynucleotides may be awed in hybridisation assays, sequencing assays and specific amplification assays for identifying an eicosanoid-related biallelic marker (ERBM) or 12-LO-related biallelic marker, and for amplifying a segment of nucleotides containing an ERBM. The polynucleotides are useful in diagnostic kits. The markers may be used to detect conditions and genotypes associated with arachidonic acid metabolism. AAC57367 to AAC58018 and AAB24019 and AAB24020 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SNPs) in the polynucleotide sequences from the present invention have been given as their corresponding degenerate bases e.g. a polymorphic base of C or T has been given as Y.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel biallelic markers useful for detecting conditions and genotypes associated with arachidonic acid metabolism -

The present sequence is human glycosyl sulfotransferase-4 (GST-4) genomic DNA encoding GST-4alpha and GST-4beta. GST-4 gene is found on chromosome 16q23.1.

Chromosome 16q23.1.

Chromosome 16q23.1.

GST is a type 2 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular generation in inhibiting a selectin mediated binding event. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus erythematosus (SLE), rheumatoid arthitis, polyarteritis nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes, glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Habhimoto's disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious caneemia, demyelinating diseases, cirrhosis, ulcerative colitis, contactory distress syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, accompaniation as pronchial asthma, hypersensitivity, rheumatic fever and tissue rejection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New glycosyl sulfotransferases (GST)-4alpha, GST-4beta and GST-6 for diagnostic and therapeutic agent screening applications

  AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB5324 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAB54007 represent sequences used in the exemplification of the present

                                                                                         genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can be used in diagnosis for detecting and mapping related genes. They can be used as probes for detecting and dispeases and disorders (e.g. identification of
AAA00010 to AAA02716 represent polynucleotides isolated from cDNA
libraries constructed from human colon cancer cell lines. The present
invention also describes a method of detecting differentially expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                    pre-metastatic or metastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor-negative breast cancer, oung cancer, and colon cancer.

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to disease of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Single nucleotide polymorphism containing sequence #641.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 792 BP; 213 A; 195 C; 144 G; 239 T; 1 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing,
                                                                                                                                                                                                                                diseases. Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or G.
                                                                                                                                                                                                                                                                                                      Sequence 792 BP; 213 A; 195 C; 145 G; 238 T; 1 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                         The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                          Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis
                                                                                                                                                                                                                                                                                                                                                                        Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; ds.

ö
nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to disease of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing,
                                                                                                                                                      Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or {\rm G}.
                                                                                                                                                                                                                                                                                                                                                                                              113 ccaggctggagtgcatggcatgatctcggctcactgcaacctccacctcctgggtt 269
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; ds.

These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             represents the position a polymorphism where the
of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or {\rm G}.
                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                    disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; ds.

Chibraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of prognosis of diseases and disorders (e.g. identification of responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             J, Innis MA, Garcia PD, Sudduth-Klinger J;

Methods from the present invention can be used for identifying genes inducible or repressible by stress, e.g. hypoxia, ionizing radiation, hypothermia or heat shock. They can also be used for the diagnosis and treatment of hypoxia related conditions e.g. cancer, ischaemia, reperfusion, retinopathy, neonatal distress, pre-eclampsia, cardiac
                                                                                                                                                                                                    Hypoxia induced gene; HIG; cancer; ischaemia; diagnosis; reperfusion; retinopathy; neonatal distress; pre-eclampsia; cardiac arrest; stroke; stress; hypoxia; ionising radiation; hypothermia; heat shock; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated hypoxia-inducible genes, used to develop products for diagnosis and treatment of hypoxia-related conditions, e.g. cancer, ischaemia, reperfusion, retinopathy, neonatal distress, pre-eclampsia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        17556 aggottggtctcgaactcctgacctcaggtgatccacccacctcagcctcccaaagtg 17612

The invention provides a method of inducing a prophylactic immune response to a self-antigen in a subject. The method comprises administering the antigen or its derivative or administering educated immune effector cells able to recognize and lyze cells expressing the self-antigen or its derivative. The method is used to stimulate an immune response against a self-antigen especially one expressed in a cancer or melanoma. The present sequence represents the DNA sequence encoding

It is used for recombinant protein production, preferably using a baculo virus vector for expression in insect cell cultures. MART-1 protein is a source of immunogenic peptides (see AAR84196 for peptide M9-2) which are optionally modified (see AAR84180) and used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).

                                                                                                                                                                     This nucleotide sequence comprises a coding region for human spacifically recognised by HLA-A restricted tunnour-infiltrating specifically recognised by HLA-A restricted tunnour-infiltrating lymphocytes of melanome patients. The invention provides methods gainst an antigen in a patient. Genetically modified antigen presenting cells (APC) that are more potent presenters of exogenous peptide than the parental antigen-presenting cells are used. These APCs lack an effective endogenous TAPP (transporter associated with antigen processing) activity and present exogenous antigen on the major histocompatibility complex class I (MHC-I) antigen. Suitable exogenous antigens include a tunnour antigen, such as a minimal essential epitopeo of MARTI, which can complex with MHC-I. The genetically modified APCs are useful for inducing an immune response (claimed) against an antigen in a patient (adoptive immunotherapy), especially as vaccines against cancer in mammals, preferably humans. The cells are also useful for expanding in mammals, preferably culls, preferably cytotoxic I would a constitution of immune effector cells, preferably cytotoxic I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    High density lipoprotein-cholesterol; HDL-C; cardiovascular; ABC1; ds.

The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABCl expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease.
                                                                                                                 Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal trighyceride level, or a cardiovascular disease, by administering a compound that modulates LXR-or RXR-mediated transcriptional activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Klinger J, Kassam

which are tumour suppressor genes in human neuroblastoma. The genes are tumour suppressor genes, base sequence data of which are applicable as tumour suppressor genes, in studying mechanism of tumour body formation, and gene diagnosis of tumours as well as in developing anti-cancer drugs. AAP97787 to AAP9795 represent PCR primers used in the exemplification of the present invention, and AAP97830 to AAP97874 represent sequences given in the exemplification of the present

                                    The present sequence is one of 3351 sequences in a library of human polynucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polynucleotides. The probes can be used for chromosome mapping of the polynucleotide and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polynucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and preventive interventions. The polynucleotides, polypeptides and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a homozygosity deletion domain co-existing in the 36-position of the first chromosome short arm (1p36) in human neuroblastoma. Also described are base sequences from the 1p36 position of human neuroblastoma cell lines (NB-1 and MASS-NB-SCH-1),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human 1p36 homozygosity deletion domain from the 36-position of first chromosome short arm in human neuroblastoma cell lines, applicable e.g. in gene diagnosis of tumors as well as in developing anti-cancer drugs
                                                                                                                                                                                                                                                                                     antibodies against them can be used in pharmaceutical compositions to treat the cancers and proliferative disorders such as neoplasia, dysplasia and hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chromosome 1; 1p36; neuroblastoma cell line; NB-1; anticancer; suppressor; human 1p36 homozygosity deletion domain; tumour;

The dCMP deaminase gene contains a 5' untranslated region (including the promoter), 5 exons, 4 introns and a 3' untranslated region (including the stop signals). The gene can be used to produce recombinant dCMP deaminase, which can be used to convert dCMP to alloy, the dCMP gene can be altered (removed or mutated) to alter DNA replication in cells, which may lead

The present invention describes a method for screening drug candidates.

The method comprises adding a drug to a cell that expresses an expression profile gene encoding a protein encoded by 5 sequences of defined base pairs as given in C55638. C55642, C55644 and C55653 or a sequence represented by Genbank accession number x92521, x62466, J04130, x62087 and x776534 (or a fragment) and determining the effect of the drug on the expression of the expression profile gene. An inhibitor of matrix metalloproteinase 19 (MMP-19), preferably an intibody, is useful for treating destructive macrophage disorders (DMD) by inhibiting DM development in a cell of an individual having arthitis. Antibodies to MMP-19 are useful for localising a therapeutic moiety preferably cytotoxic agent or a radioisotope to colorectal cancer tissue. A composition comprising MMP-19 is useful for eliciting an immune response in an individual. C55635 to C55710 represent human configuration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Screening drug candidates comprises adding a drug to a cell expressing an expression profile gene and determining the effect of the drug on the expression of the expression profile gene \,
deaminase gene, which contains a 5' untranslated region (including the promoter), 5 exons, 4 introns and a 3' untranslated region (including the stop signals). The gene can be used to produce recombinant dCMP deaminase, which can be used to convert dCMP to dUMP. Also, the dCMP gene can be altered (removed or mutated) to alter DNA
                                                                                                                                                                                                                                          Human; differentially regulated gene; macrophage development; diagnosis; matrix metalloproteinase 19; MMP19; antiarthritic; antiinflammatory; destructive macrophage development inhibitor; arthritis; colorectal cancer; immune response; ss.
